

BIG MOUNTAIN SKI RESORT TICKET PRICE PREDICTION

A CAPSTONE PROJECT IN DATA SCIENCE

GANESH BHANDARI

Problem Background

- Big Mountain Ski Resort is located in Montana and offering spectacular views of Glacier National Park and Flathead National Forest with access to 105 trails.
- Every year about 350,000 people ski or snowboard at Big Mountain.

Problem Background

- The Resort has been charged a premium above the average price of resorts in its market segment.
- Big Mountain Resort wants some guidance on how to select a better value for ticket price based on its facilities so that the resort can increase its revenue.

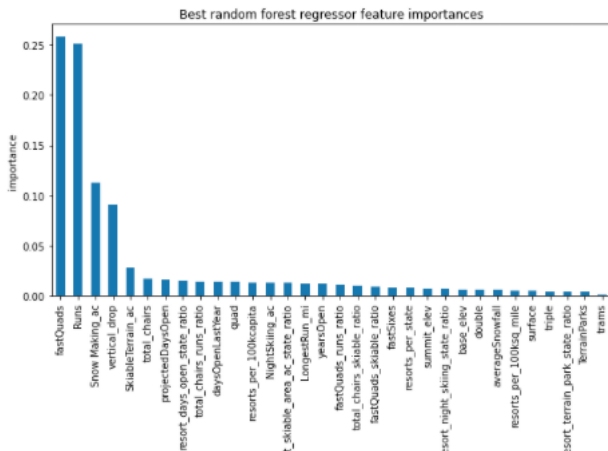

Current Situation:

- The Big Mountain Resort is currently charging \$ 81 per ticket which is very high price in comparison with with US average price of \$ 64 and Montana average price of \$ 52

Model:

- Used the RandomForestRegressor of sklearn inside the pipeline.
- Used cross-validation method to pick the best number k of features and found $k = 17$.

Findings and Recommendations:

- The Big Mountain Resort is currently charging \$ 81 per ticket.
- According to the model, the modeled ticket price at the Big Mountain Resort should be \$ 95.87.

Findings and Recommendations:

- **Scenario 1:** In the first scenario, if Big Mountain is adding a run, increasing the vertical drop by 150 feet, and installing an additional chair lift then the revenue can be expected to increase by the amount \$ 3474638 with the increase of ticket price by \$ 1.99.
- **Scenario 2:** In the second scenario, if Big Mountain is repeating the same previous facilities with the addition of 2 acres of snow making then the revenue can be expected to increase again by the amount \$ 3474638 with the increase of ticket price by \$ 1.99.

Findings and Recommendations:

- The model says closing one run makes no difference. Closing 2 and 3 successively reduces support for ticket price and so revenue.
- If Big Mountain closes down 3 runs, it seems they may as well close down 4 or 5 as theres no further loss in ticket price.
- Increasing the closures down to 6 or more leads to a large drop.

Findings and Recommendations:
